

Detailed Process Maps Using Swimlane Diagrams

Project: HealthFirst Care Operational Efficiency Initiative
Prepared By: Brian McCarthy
Role: Business Analyst

This report applies advanced BPMN and Swimlane Diagram techniques to analyze and optimize operational workflows at HealthFirst Care Hospital. The diagrams clarify stakeholder responsibilities, identify inefficiencies, and propose improved workflows to enhance patient satisfaction and operational efficiency.

Key Challenges Identified

Manual appointment scheduling caused delays and double bookings.
Patient check-in processes relied heavily on manual paperwork.
Interdepartmental communication lacked clear ownership and automation.
Resource allocation bottlenecks impacted patient treatment timelines.
Limited real-time notifications reduced transparency for patients.

Advanced BPMN Modeling

The workflows incorporate BPMN concepts such as: **Decision Gateways:** Appointment slot availability and discharge approvals. **Subprocesses:** Notification handling and discharge summary generation. **Event Triggers:** Appointment requests, patient arrivals, and feedback collection.

Appointment Scheduling Workflow

Patient Check-In and Resource Allocation Workflow

Discharge Planning Workflow

Proposed Improvements

Automated scheduling systems reduce conflicts and improve appointment visibility.
Self-service check-in kiosks reduce patient wait times.
Centralized dashboards improve communication between departments.
Automated alerts improve task ownership and accountability.
Clear swimlane role assignments reduce process ambiguity and delays.

Conclusion

The BPMN and Swimlane Diagrams developed for HealthFirst Care provide a detailed representation of stakeholder interactions and workflow dependencies. The optimized process designs improve scheduling efficiency, reduce delays, strengthen communication, and support operational excellence across departments.
