

Product Manager Beta Test Analysis - Stay Cool LLC

Written by Brian McCarthy

Issues and follow-up actions

Beta planning issue	Recommendation
Test vehicle scope was ambiguous: SC planned one armored vehicle type while customer expected multiple armored vehicle types.	Create a written beta configuration matrix that identifies every vehicle type, prototype, environment, test case, and acceptance condition. Require customer sign-off before scheduling.
Time zone assumptions created schedule delays because the plan used CST while some attendees expected EST.	Publish all schedules with named time zones, local time conversions, calendar invites, and a 24-hour reminder. Assign a coordinator to validate attendance logistics.
Video recording was planned but military security regulations prohibited it.	Complete a security and legal review before the beta. Prepare approved alternatives such as structured observer notes, paper forms, secure survey tools, and debrief interviews.
Communications were not timely and caused confusion.	Develop a formal communications management plan with stakeholder groups, owners, frequency, distribution channels, escalation paths, and approval checkpoints.
Objective success criteria and KPIs were not defined before the test.	Define SMART beta objectives before execution, including cooling performance, installation time, defect rate, user satisfaction, issue closure, and launch readiness thresholds.
Feedback collection had to be redesigned during the test.	Define feedback methods in advance and categorize feedback by severity, vehicle type, role, model, and launch impact. Store all feedback in a shared issue log.
Commercial users were not included in the initial beta despite phased commercial launches.	Add commercial beta cohorts for trains, ships, and other high-temperature vehicles, with separate test cases and use-environment assumptions.
