

Product Manager Launch Readiness Assessment - Stay Cool LLC

Written by Brian McCarthy

Readiness issues and recommendations

Readiness issue	Recommendation
Quality Control identified an electrical blower problem that may impact multiple mobile HVAC models.	Do not approve full launch until supplier root-cause analysis, containment, replacement inventory, and regression testing are complete. Establish a launch-blocking defect threshold.
Security-oriented plain packaging has not been validated for shipping protection.	Conduct packaging validation tests immediately, including drop, vibration, labeling, discrete delivery, and damage inspection criteria. Obtain customer and manufacturing approval.
Distribution and assembly locations are not finalized for vehicles across numerous regions.	Finalize a site-by-site installation map, delivery schedule, contact list, staging plan, and contingency process for newly discovered vehicles.
Sales and channel readiness is weak for commercial launches and more than twenty channels are unfamiliar with the system.	Create sales training, channel playbooks, target account lists, commercial buyer personas, demo scripts, pricing guides, and enablement sessions before commercial launch acceleration.
Commercial marketing collateral is still in design while commercial launches may start within three months.	Prioritize commercial collateral for trains, ships, and high-temperature vehicles; approve minimum viable collateral before any commercial sales push.
Military and commercial pricing structures are not fully aligned with costs and delivery/install differences.	Finalize segmented pricing models, discount authority, installation assumptions, and margin checks before quoting commercial prospects.
Commercial manual for ship and boat mobile HVAC systems is incomplete.	Assign an owner and deadline for completing, reviewing, and releasing the manual before commercial ship/boat launch.
Help desk needs customer contacts and product ID numbers.	Provide support with a customer contact database, product IDs/SKUs, warranty rules, escalation contacts, and launch-day call scripts.
