

Product Manager Product EOL Scenarios Worksheet

Written by Brian McCarthy

EOL evaluation for Microsoft, Apple, and Intel scenarios

Company / Product	EOL consideration	Applicable (Y/N)	Comments
Microsoft Windows	Product identification	Y	Each Windows release needs clear version, edition, license, support date, and migration-path documentation.
Microsoft Windows	Rationale	Y	Customers need to understand why an older version is retiring, especially when security, AI capability, hardware support, and support costs are involved.
Microsoft Windows	Retirement strategy	Y	A staged support retirement with upgrade incentives and enterprise migration planning is appropriate.
Microsoft Windows	Communications management	Y	Enterprise, government, education, OEM, and consumer users need long notice, technical guidance, and risk messaging.
Microsoft Windows	Internal and external impact	Y	Internal support, patching, documentation, partners, OEMs, and customers are heavily affected.
Apple iPhone	Product identification	Y	Each model, iOS support level, repair parts policy, and trade-in path must be identified.
Apple iPhone	Rationale	Y	Annual model refreshes make clear rationale important so customers understand support windows and upgrade value.
Apple iPhone	Retirement strategy	Y	A harvest and transition strategy works: keep older models for value tiers, then phase out sales and parts over time.
Apple iPhone	Communications management	Y	Consumers, carriers, app developers, service providers, and retailers need release, support, and availability updates.
Apple iPhone	Risk analysis	Y	Risks include customer backlash, inventory imbalance, app compatibility, battery/service issues, and carrier disruption.
Intel processors	Product identification	Y	Processor generation, family, socket/platform, chipset, firmware, warranty, and support dates must be explicit.
Intel processors	Retirement strategy	Y	A planned transition protects OEM roadmaps and helps customers migrate between processor generations.
Intel processors	Internal impact analysis	Y	Manufacturing, supply chain, validation labs, firmware teams, and sales engineering are directly affected.
Intel processors	External impact analysis	Y	OEMs, system builders, enterprise buyers, and software partners need lifecycle dates and migration guidance.
Intel processors	Cost and risk analysis	Y	Inventory, wafer capacity, support obligations, supply shortages, platform compatibility, and performance expectations require analysis.
