

Customer Support Use Case Worksheet - Innovative Bank

Completed generative AI use case revision and comparison notes

Innovative Bank - Generative AI Customer Support Use Case

Task 2: Prompt to Improve the Use Case

Review Innovative Bank's current customer support use case. Identify issues caused by call queues, scripted responses, transfers, delayed callbacks, and customer dissatisfaction. Recommend a revised use case using generative AI to improve personalization, efficiency, and customer experience.

Task 3: Revised Use Case with Generative AI

Use Case Element	Revised Generative AI Approach
Objectives	Provide faster, more personalized support; reduce wait times; improve first-contact resolution; retain customers by resolving urgent banking issues efficiently and securely.
Problem statement	The current call-based model uses broad categories and scripted responses, causing long waits, unnecessary transfers, and inconsistent answers. Generative AI can triage intent, provide guided self-service, assist agents, and summarize cases.
Step 1: Intake	A conversational AI assistant greets the customer and uses natural language understanding to identify the issue, such as a lost credit card, account question, fraud concern, or transaction dispute.
Step 2: Authentication and routing	The AI guides secure identity verification and routes the case based on urgency, risk, and required permissions. Lost or stolen card requests receive priority.
Step 3: Immediate assistance	For supported requests, the AI provides approved guidance and initiates workflows such as card freeze instructions, replacement request preparation, or FAQs.
Step 4: Human handoff	When a human agent is needed, the AI transfers the customer with context, intent, authentication status, and a concise summary so the customer does not repeat information.
Step 5: Documentation	The system automatically records call notes, categorizes the inquiry, flags unresolved cases, and recommends next actions for follow-up.
Benefits	Reduced waiting times, better personalization, fewer transfers, improved consistency, stronger case documentation, and continuous learning from inquiry data.

Sample Scenario

A customer reports a lost credit card. The AI assistant identifies the issue, confirms identity through secure steps, immediately guides the customer to freeze the card, prepares the replacement request, and transfers to a specialized agent only if required. The agent receives a complete summary and finalizes the action quickly.

Alternative Scenario

If the AI detects a system exception, fraud indicator, or unsupported request, it escalates to a specialist with all context and creates a pending case with a clear follow-up owner and timeline, instead of simply promising a callback without analysis.

Task 4 and Task 5: Comparison Notes

Compared with the provided potential solution, this version preserves the same core improvements: AI intake, immediate response, specialized handoff, agent assistance, automated documentation, reduced waiting time, and better retention. It adds explicit authentication and urgency routing to address the banking context more safely.
